Newton Raphson Solution Iterations for EE in 3D Space

4.

Fig. 4: Output Plot of EE Position

5.

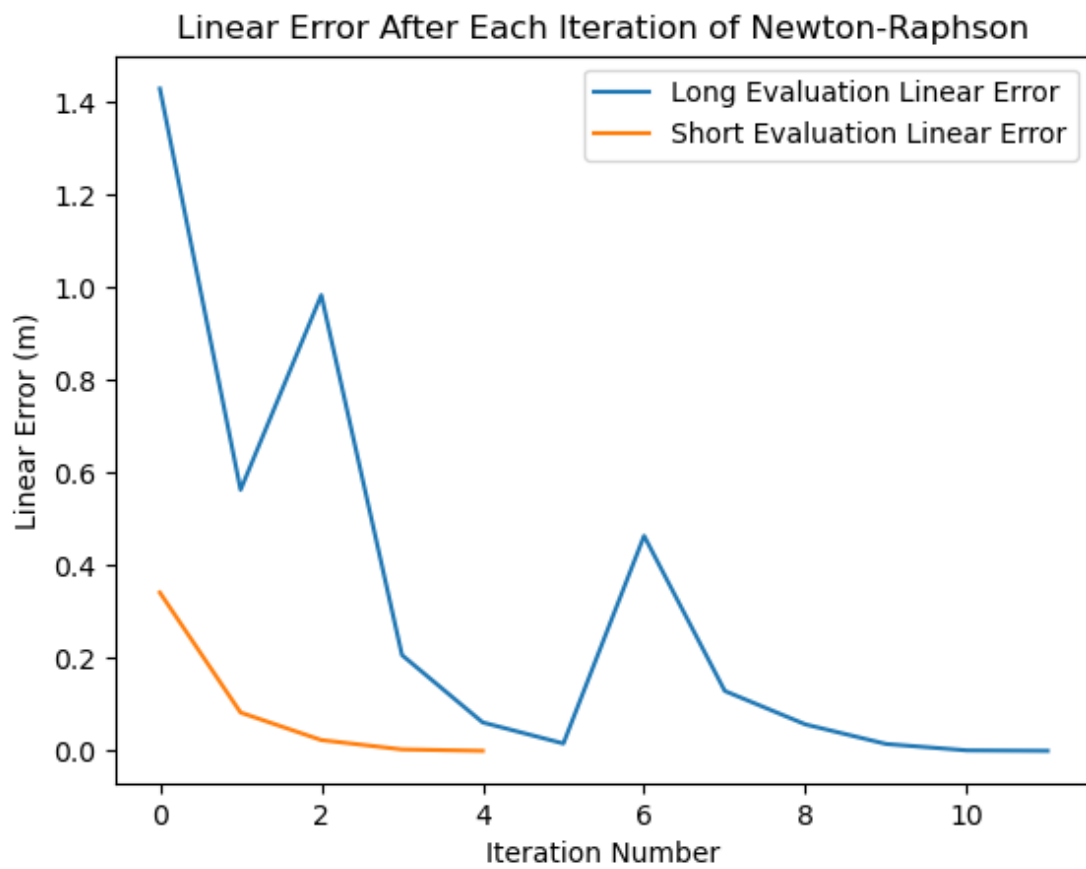

Fig. 5: Output Plot of Linear Error

6.

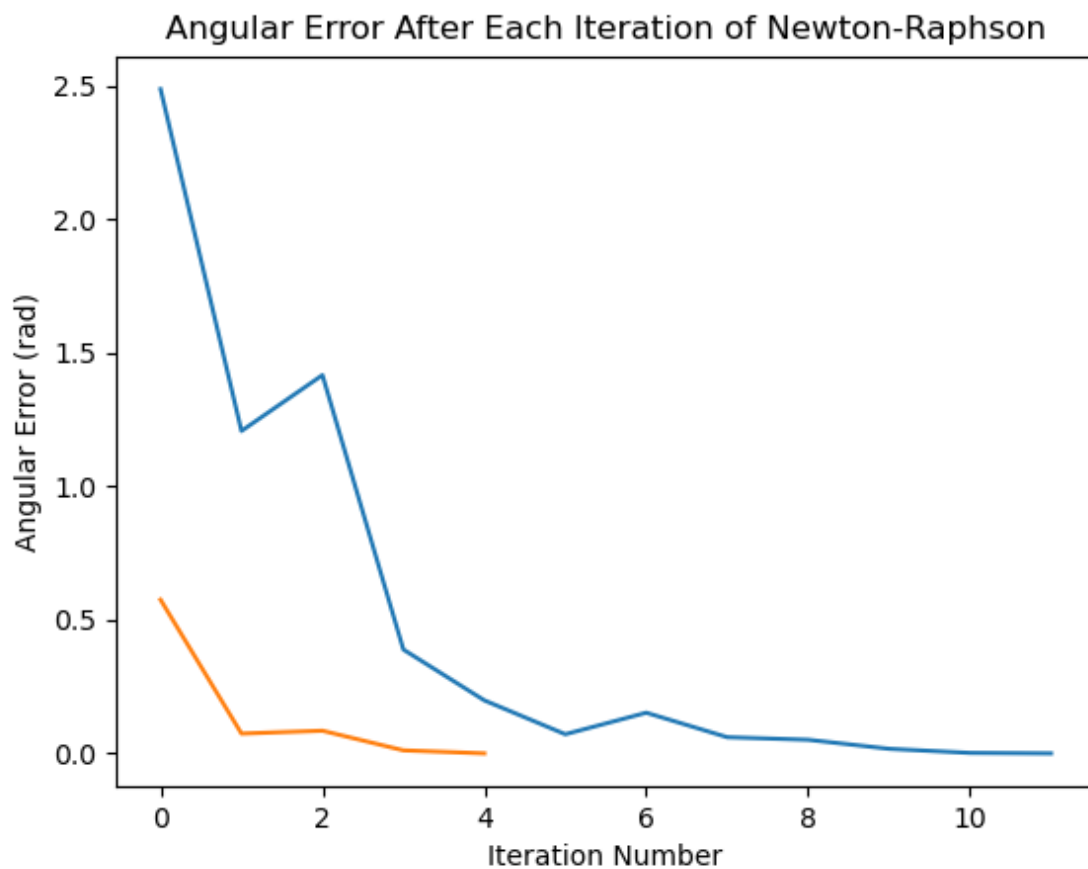

Fig. 6: Output Plot of Angular Error

7. Convergence is difficult from the “Long” guess because the end effector is further from the goal position and orientation. Because the goal is far away, more iterations are needed to get the joints in the correct orientation. As the current guess gets closer to the goal orientation with each iteration, the change in each joint angle in the next iteration decreases. This means that an initial guess that is closer to the solution may only need a handful of guesses to reach the goal, while a guess that is further away may make a few larger jumps and then several smaller ones to get to the correct configuration. This is exactly what can be seen in the attached CoppeliaSim videos, which show the “Long” iteration case starting further from the goal and taking longer to reach the correct location.

Appendix 1: Full Code Output
